than 2.x). Mozilla Windows Firefox v 2.0.0.17 Official Builds The Download. the rotating magnetic field, which has a positive sign. Hence, ferromagnetism is induced in the magnetization of the FeCo layer, and as a result, magnetoresistance is reduced. When the angle of magnetization of the CoFe layer is increased, the angle of magnetization of the CoFe layer changes, and the peak angle of the magnetization of the CoFe layer increases. This results in more rotation of magnetization of the CoFe layer, and the positive and negative magnetic field of the magnetic disk surface become more intense. Accordingly, the

---

peak angle of the magnetization of the CoFe layer decreases, and magnetoresistance increases. With the rotating magnetic field, the torque exerted on the CoFe layer by the exchange coupling with the FeCo layer is, however, reversed.

To explain this, we take a reference magnetization vector of the CoFe layer, where the angle of the magnetization vector is supposed to be 0, and a quantization axis of the FeCo layer. FIG. 18 shows the magnetization direction of the CoFe layer when the rotating magnetic field is applied. As the rotating magnetic field is applied, the angle between the

---

# magnetization direction of the CoFe layer and the magnetization direction of the c6a93da74d
